Functional Requirements Document (FRD)

CRM Lead & Sales Pipeline Management System | Self-initiated BA portfolio case study

1. Overview

This FRD translates the portfolio BRD into proposed system behaviors. Requirements are design proposals for a fictional case study, not specifications from a deployed system.

ID	Function	Requirement statement	Priority
FR-01	Create lead	The system shall provide a form to create a lead record.	High
FR-02	Validate required fields	The system shall require lead name, company, source, owner, and at least one contact method.	High
FR-03	Assign lead owner	The system shall associate each lead with one assigned sales executive.	High
FR-04	Manage lead status	The system shall allow authorized users to update status using approved values.	High
FR-05	Qualify lead	The system shall support recording qualification result against agreed criteria.	High
FR-06	Record activities	The system shall store contact attempts, dates, outcomes, and notes.	High
FR-07	Display dashboard	The system shall summarize leads by status, source, and owner.	High
FR-08	Maintain history	The system shall store status changes with user and timestamp.	Medium
FR-09	Report lost reasons	The system shall capture and summarize lost reasons.	Medium
FR-10	Follow-up reminders	If approved, the system may notify users about planned follow-ups.	Pending approval

2. Validation behavior

Condition	Expected behavior
Company name blank	Block save and display validation message.
Both email and phone blank	Block save and request at least one contact method.
Lead source missing	Block save.
Assigned executive missing	Block save.
Duplicate suspected	Proposed warning or review flow; exact rule to be confirmed.
Status changed	Save new status and append history record.

3. Dashboard metric definition

Lead Conversion Rate = Converted Leads / Total Leads × 100. The reporting population and date filters must be shown or documented. Total Leads means unique lead records in the selected population.

4. Non-functional considerations

Area	Proposed consideration
Access control	Users should only access functions permitted by their role.
Auditability	Important changes should be attributable to a user and timestamp.
Usability	Required fields and validation messages should be clear.
Data quality	Dropdowns should reduce inconsistent source/status values.
Performance	Dashboard should load within a business-agreed response time; target to be defined.
